

ComicCraft - AI Comic Story Creator using Gemini Models

2. Problem Identification

Technology Track: Generative AI with Google

1. The Problem

Creating a comic strip normally requires two separate skills: writing a story and illustrating it. Most people who have a good story idea do not know how to draw, and most people who can draw don't always know how to pace a story into panels. This skill gap keeps comic creation out of reach for the average person.

2. Detailed Problem Areas

- Manual comic creation takes significant time and artistic training that casual users do not have.
- Existing comic-maker tools mostly rely on pre-made templates and stock clip-art, offering little help with original artwork or story structure.
- Teachers and students who want to visually explain a topic or story have no quick way to generate custom illustrations.
- There is a lack of simple tools that combine AI-written dialogue with AI-generated art into one finished, coherent comic.
- Keeping a character's appearance consistent from panel to panel is difficult without a dedicated system to manage it.

3. Impact of the Problem

Affected Group	Impact
Students	Cannot easily produce illustrated assignments or creative projects.
Teachers	Spend extra time or skip adding visual aids to lessons and stories.
Hobby Writers	Struggle to bring their stories to life visually without hiring an artist.
Content Creators	Limited to text-only or template-based content on social platforms.

4. Why the Problem Needs an AI-Based Solution

- Manually pairing a text generator and an image generator is slow and technically complex for a non-developer.
- Consistent character appearance across panels needs careful prompt management that most users would not do on their own.

- An automated pipeline saves time by handling scene breakdown, caption writing, and artwork generation together.

5. Problem Statement

There is a need for an accessible tool that can take a plain-text story idea and automatically produce a complete, illustrated, multi-panel comic strip — with consistent artwork and appropriate captions — without requiring the user to have any writing or drawing expertise.

6. Summary

ComicCraft was designed specifically to address this gap by combining Google Gemini's text and image generation into one pipeline, removing the need for separate writing and illustration skills to produce a finished comic.
